## 1 Limits

### 1.1 Identities

The following are identities used to prove Theorem 1:

$$\left(H_\nu^{(1)}(z)\right)' = H_{\nu-1}^{(1)} - \frac{\nu}{z} H_\nu^{(1)}(z) \quad (1)$$

$$H_0^{(1)}(z) \sim \frac{2i}{\pi} \ln z \quad k \rightarrow 0 \quad (2)$$

$$H_\nu^{(1)}(z) \sim -\frac{i}{\pi} \Gamma(\nu) \left(\frac{z}{2}\right)^{-\nu} \quad k \rightarrow 0 \quad (3)$$

### 1.2 Proof of Limit

#### Theorem 1

Let

$$T_{ik}w = \sum_n w_n \gamma_n e^{in\theta} \quad (4)$$

Where

$$\gamma_n = \frac{ik \left(H_n^{(1)}(ikR)\right)'}{H_n^{(1)}(ikR)} \quad (5)$$

Then we have

$$\lim_{k \rightarrow 0} \gamma_n = \frac{-|n|}{R} \quad (6)$$

*Proof.* We first use identities to calculate  $\left(H_n^{(1)}(ikR)\right)'$ . We see

$$\left(H_n^{(1)}(ikR)\right)' = H_{n-1}^{(1)}(ikR) - \frac{n}{ikR} H_n^{(1)}(ikR) \quad (7)$$

So then

$$\gamma_n = \frac{ik \left(H_{n-1}^{(1)}(ikR) - \frac{n}{ikR} H_n^{(1)}(ikR)\right)}{H_n^{(1)}(ikR)} \quad (8)$$

Taking the limit as  $k \rightarrow 0$  we see

$$\lim_{k \rightarrow 0} \gamma_n = \lim_{k \rightarrow 0} ik \frac{\left( H_{n-1}^{(1)}(ikR) - \frac{n}{ikR} H_n^{(1)}(ikR) \right)}{H_n^{(1)}(ikR)} \quad (9)$$

$$= \lim_{k \rightarrow 0} \frac{ik H_{n-1}^{(1)}(ikR)}{H_n^{(1)}(ikR)} - \frac{ik}{ik} \frac{-n H_n^{(1)}(ikR)}{R H_n^{(1)}(ikR)} \quad (10)$$

$$= \lim_{k \rightarrow 0} \frac{ik H_{n-1}^{(1)}(ikR)}{H_n^{(1)}(ikR)} + \frac{-n}{R} \quad (11)$$

Now, if we compute the limit in the first term we get

$$\lim_{k \rightarrow 0} \frac{ik H_{n-1}^{(1)}(ikR)}{H_n^{(1)}(ikR)} \sim \lim_{k \rightarrow 0} \frac{ik \left( -\frac{i}{\pi} \Gamma(n-1) \left( \frac{ikR}{2} \right)^{1-n} \right)}{\left( -\frac{i}{\pi} \Gamma(n) \left( \frac{ikR}{2} \right)^{-n} \right)} \quad (12)$$

$$= \lim_{k \rightarrow 0} \frac{-k^2 R \Gamma(n-1)}{2 \Gamma(n)} \quad (13)$$

$$= 0 \quad (14)$$

For all  $n > 1$ . When  $n = 0$ , we have the following:

$$\lim_{k \rightarrow 0} \frac{ik H_{-1}^{(1)}(ikR)}{H_0^{(1)}(ikR)} \sim \lim_{k \rightarrow 0} \frac{ik \left( -\frac{ie^{-\pi i}}{\pi} \Gamma(-1) \left( \frac{ikR}{2} \right) \right)}{\frac{2i}{\pi} \ln(ikR)} \quad (15)$$

$$= \lim_{k \rightarrow 0} \frac{-ik^2 R e^{-\pi i} \Gamma(-1)}{4 \ln(ikr)} \quad (16)$$

$$= 0 \quad (17)$$

When  $n = 1$  we have

$$\lim_{k \rightarrow 0} \frac{ik H_0^{(1)}(ikR)}{H_1^{(1)}(ikR)} \sim \lim_{k \rightarrow 0} \frac{ik \frac{2i}{\pi} \ln(ikr)}{-\frac{i}{\pi} \Gamma(1) \left( \frac{2}{ikr} \right)} \quad (18)$$

$$= \lim_{k \rightarrow 0} \frac{k^2 R \ln(ikR)}{\Gamma(1)} = \lim_{k \rightarrow 0} \frac{R \ln(ikR)}{\Gamma(1) \frac{1}{k^2}} \quad (19)$$

$$= \lim_{k \rightarrow 0} \frac{R \frac{iR}{ikR}}{-\Gamma(1) \frac{2}{k^3}} = \lim_{k \rightarrow 0} \frac{k^2 R}{2 \Gamma(1)} = 0 \quad (20)$$

With this, we have shown that Theorem 1 holds for any  $n \geq 0$ . □
